

Computing Machinery I

Assignment 6

File I/O and Floating-Point Numbers

Write an ARMv8 assembly language program to compute the function $\arctan(x)$ using the series expansion shown below. Use double precision floating-point numbers. The program will read a series of input values from a file whose name is specified at the command line. The input values will be in binary format; each number will be double precision (and thus each is 8 bytes long). Read from the file using system I/O (i.e. generate an exception using the *svc* instruction). Process the input values one at a time using a loop (be sure to detect end-of-file correctly), calculate $\arctan(x)$, and then use *printf()* to print out the input value and its corresponding output values in table form (i.e. in columns, with column headings) to the screen (standard output). Print out all values with a precision of 10 decimal digits to the right of the decimal point.

You can compute the function $\arctan(x)$ according to the following series expansion:

$$\arctan(x) = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \dots$$

where x is a real number input to the function and $|x| < 1$. Continue to accumulate terms in the series until the absolute value of the term is less than $1.0\text{e-}13$.

Run your program using the input binary file supplied on D2L. Capture its execution using the *script* UNIX command, and name the output file *script.txt*.

New Skills need for this Assignment:

- Use of system I/O (exceptions) to open and read an input binary file
- Understanding and use of floating-point single and double formats
- Use of floating-point instructions to do simple calculations
- Use of floating-point comparison instructions

Submit the following:

1. Your assembly source code and script via electronic submission. Use the *Assignment 6* Dropbox Folder in D2L to submit electronically. Your TA will assemble and run your program to test it. Name your program *a6.asm* and the script as *script.txt*.

Assignment 6 Grading

Student: _____

| | | | |
|---|-----------|-------|---------|
| Command line arguments | 2 | _____ | |
| Loop to read in data | 2 | _____ | |
| File I/O using exceptions | 4 | _____ | |
| arctan(x) routine | 6 | _____ | |
| Screen output using printf() | 2 | _____ | |
| Correct use of floating-point instructions | 2 | _____ | |
| Script showing I/O | 2 | _____ | |
| Complete documentation and commenting | 4 | _____ | |
| Formatting (use of columns and white space) | 4 | _____ | |
| Design quality | 2 | _____ | |
| Total | 30 | _____ | _____ % |
